

## **Presentation Title**

# **Clinical Monitoring using eSource**

(Language: Japanese only)

## **Presentation Introduction**

Now days, new methods and technologies are bringing more and more efficiency to conduct clinical trials. Few years ago, Risk Based Monitoring was one of the new methods but today we are using risk based approach as a standard. Moreover, the most dynamic change we experienced in the technology side was the paper CRF changed to EDC.

As a part of providing our eClinical Solution, A2 considers that it is inevitable that the use of eSource data will expand in clinical trials. To take the lead in this new approach A2 have been the only Japanese partner of Medrio – an innovative system provider for eSource.

The concept of eSource is to perform more first recording to the EDC. A2 have conducted a study with 99.4% of the data points captured as eSource. By this, we can drastically reduce the number of SDV visits and reduce cost. Moreover the data will be recorded in high quality.

In this Luncheon, A2 will explain more about eSource with introducing some of actual experiences in actual studies we have experienced.

**\* This luncheon will be only open to our sponsors and vendors. Sorry no competitors allowed.**

**\* Language is in Japanese.**
